

# Antiplatelet Drugs and Your Dental Treatment

## Information for Patients

**This information is for anyone who is taking an antiplatelet drug:**

- **aspirin**;
- **clopidogrel** (Plavix, Grepid);
- **dipyridamole** (Persantin, Persantin Retard, Attia Modified Release, Ofcram PR, Asasantin Retard, Molita Modified Release);
- **prasugrel** (Efient);
- **ticagrelor** (Brilique);

**or a combination of these, and needs dental treatment.**

## Why have I been given this leaflet?

**You have been given this leaflet because the medication you are taking can affect your dental treatment.**

The antiplatelet drug or 'blood-thinner' you are taking helps to prevent harmful blood clots from forming in your blood vessels. Because these drugs work by reducing the formation of blood clots, they can also make you bleed more easily and for longer. This may happen especially if you are having treatment which would normally cause bleeding, such as some dental procedures.

There are some things that you and your dentist can do to reduce the chance of you having any bleeding problems after dental treatment (see pages 3 & 4).

## Can I clean my teeth as usual while taking an antiplatelet drug(s)?

**Yes, it is important for everyone to maintain good oral hygiene and you should continue to clean your teeth as usual.**

Poor oral hygiene can lead to periodontal disease (gum disease) where the gums become swollen and bleed more easily. By taking care of your oral health you can prevent gum disease and also reduce the need for dental treatment that might cause bleeding.

You should still go to your dentist and hygienist as usual when taking an antiplatelet drug(s).

## What do I need to do?

**It is very important that your dentist knows what medications you are taking and what medical conditions you have.**

By dentist we also mean your dental hygienist or dental therapist.

- Tell your dentist which antiplatelet drug or combination you are taking.
- Tell the dentist about **all** other medications you are taking, both prescribed and non-prescribed.
  - It would be helpful to show the dentist all of your prescriptions.
  - Aspirin and other non-steroidal anti-inflammatory drugs (NSAIDs) such as ibuprofen and diclofenac can cause you to bleed more.
  - You should also tell your dentist about any herbal or complementary medicines you are taking.
- Tell the dentist about any medical conditions that you have, particularly if you have a kidney or liver condition.
  - These conditions can cause you to bleed more.

This information will allow your dentist to decide on the most suitable treatment for you. Your dentist may contact your doctor if he/she requires more information.

## What will my dentist do?

**Your dentist will plan the most suitable dental treatment for you. He/she will discuss your treatment options with you.**

Your dentist can also take other steps to minimise any bleeding that takes place during your dental treatment.

- In most cases your dentist will be able to carry out your dental treatment as usual and will not advise you to alter your medication.
- Your dentist may only carry out a small amount of treatment to start with, or may spread out your treatment over several visits.
- Your dentist might put some sutures (stitches) in to help stop any bleeding.

It is very important that you do not stop taking your antiplatelet drug(s) unless instructed to do so by your doctor.

Your dentist will give you information about what to do after your treatment and who to contact if you have any concerns about post-treatment bleeding.

Scottish Dental  
Clinical Effectiveness Programme

This leaflet has been developed by the **Scottish Dental Clinical Effectiveness Programme (SDCEP)**, part of NHS Education for Scotland. This and other patient information is available on the SDCEP website.
